Department of Computer Science and Engineering

Guidelines for Project Selection in Full Stack Development (FSD) Track

General Guidelines for Project Selection

1. Team composition
2. Topic selection
3. Technology Stack
4. Evaluation Criteria
5. Submission process

Please carefully follow the instructions below for group formation and project topic selection:

1. **Group Formation:**
    - Each group must have **5 members.**
    - The group composition should include:
        - **2 members from Bin 1**
        - **2 members from Bin 2**
        - **1 member from Bin 3**
2. **Technology Stack:**
    - All projects must exclusively use the **JS stack.**
3. **Project Continuity:**
    - The selected project will continue for **3 semesters**.
        - First Sem - FFSD: Basic Front end design using EJS, MJS(start with HTML), CSS, Node, JS etc (Multi Page Application)
        - Second Sem - FDFED: SPA (Using React and Redux)

        - Third Sem - Web Services and Deployment
    - Choose a project that can be extended to align with the Full Stack Development (FSD) track requirements.
4. **Dashboard Requirements:**
    - The project must include at least **3 different types of dashboards *(for min three types of use cases/users)*** .
        - *Based on requirements it can be more than 3.*
    - Each dashboard should support **statistical analysis *(including unique functionality such as graphs, tables, stocks list etc.)***.
5. **Revenue Model:**
    - The project must include a well-defined **revenue model**.
6. **API Integration:** *(Your project should support API integration at next level)* ○ The project must have the capability to integrate **B2B and B2C APIs**. ○ APIs should allow both **consumption** and **exposure**.
    - The project should have the option to be scalable as per the requirement.

Please ensure that your project idea aligns with these requirements to facilitate successful completion over the three semesters.

Please find the detailed review criteria for FSD-1 outlined below. It is crucial to understand and adhere to these expectations to ensure the successful completion of your projects.

Zeroth Review:

- **Objective:** Evaluate if the project idea aligns with the FSD track requirements.
- Projects deemed unsuitable will need revision or redefinition.

1st Review:

Focus Area: Project Requirements

1. **Frontend:**
    - All HTML/CSS (+framework) work should be completed.
    - Static (HTML+CSS) pages are acceptable for complex designs, but the **basic layout** must be ready.
    - **No new pages** can be added after the mid-review unless pre-approved.
    - **Template Engine:** Use **EJS** for all templates.
2. **Form Validation:**
    - All frontend forms must have proper **JavaScript validation** implemented.
3. **Backend Implementation:**
    - Some backend functionality must be in place using **in-memory databases** (Node + Express + EJS).

Final Review:

Focus Area: Fully Functional Multi-Page Dynamic Web Application

- The application must use an **external persistent RDBMS/NoSQL Database.**
- It must fulfill all promised functionality and features as per your proposal.

Feature Classification and Expectations:

1. **Core Functionality (Mandatory):**
    - Examples:
        - User registration (Doctor/Patient) with profile update functionality.
        - Doctor: Manage available slots.
        - Patient: Search for doctors, book appointments, give feedback.
        - Appointment management (accept/reject requests, view calendar/events).
2. **Secondary Functionality (Mandatory):**
    - Examples:
        - Admin portal for user management, announcements, and privileges.
        - Verification processes (e.g., validating doctor credentials).
3. **Auxiliary Functionality (Optional but Appreciated):**
    - Examples:
        - Chat interface for communication.
        - Blog for health tips or exercises.
        - Video call functionality for online appointments.

Important Notes:

- **100% Completion:** Core and Secondary functionality must be fully implemented. ● **Auxiliary Features:** These are optional but add value. However, groups prioritizing auxiliary features at the expense of Core and Secondary will face **severe consequences.**

Reminder: Stay focused on the core and secondary functionalities as advised. Deviating from this will not be acceptable.

As part of the all FSD(1,2 &3) project reviews, we have specific **individual requirements** that every member of the group must adhere to. Please read the instructions below carefully:

Individual Requirements:

1. **Codebase Knowledge:**

    - Every group member should have a thorough understanding of the entire codebase.
    - Excuses like "I worked on X, so I don't know about Y" will **not be accepted.**
2. **Technical Preparedness:**
    - Be ready to answer **in-depth questions** about your project.
    - In some cases, you may be asked to implement a **small modification on the fly** during the review.
    - Ensure the **latest working version of the codebase** is available on your laptop and is fully operational.
3. **Contribution Verification:**
    - If it is found that an individual did not contribute meaningfully to the project, they will face a **major penalty.**

Please ensure you are fully prepared to meet these expectations. Every member's contribution and understanding are critical to the project's success.
